Building beautiful and sustainable houses.

Building a sustainable house starts with laying proper **foundations**.

The next step is **building** the house from the ground up with home made blocks supported by iron wire.

The carcass of your house is finished by putting either a **pitched roof** or a **flat roof** with proper drainage on your one, two or three story house. To protect the house from the weather and to smoothen it up plasterers will **plaster** the entire house.

final touch is given with a **paint job** that can be done in any desirable color.

For the inside of the house electricians and plumbers make sure **wiring** is integrated and **plumbing** is done properly.

Inside and outside beautiful decorations can be added by one of our plasterers. Especially arches, wooden ceilings, decorative pillars and decorative figures are done frequently.
